TASK 1 – PROJECT SYNOPSIS

Project: Student Placement and Recruitment Management System

1. What is the Project?

This project is a system for managing college placement activities. Students can create their profiles, upload resumes, see job openings and apply for jobs. The placement team can add company details, post jobs and check student applications. Students can also see their application and interview status.

In simple words: It keeps student, company and job information in one place and makes placement work easier.

2. Scope of the Project

Student Module

• Register or get registered by the placement team and log in.

• Fill in name, email, phone, address, qualification, skills and domain.

• Add projects, certificates and profile links; upload photo and resume.

• View job openings, apply or opt out, and check application status.

Admin / Placement Team Module

• Log in and register or approve students; share login details.

• Add company details and job requirements.

• Filter students by domain, passing year, location, package and other criteria.

• Track applications, update status and maintain interview and hiring records.

• Maintain company visit details and view placement dashboard.

Company Module

• Maintain company profile and contact details.

• Add more than one job requirement.

• Set eligibility criteria and share hiring status, comments and notes.

• Post future job requirements again.

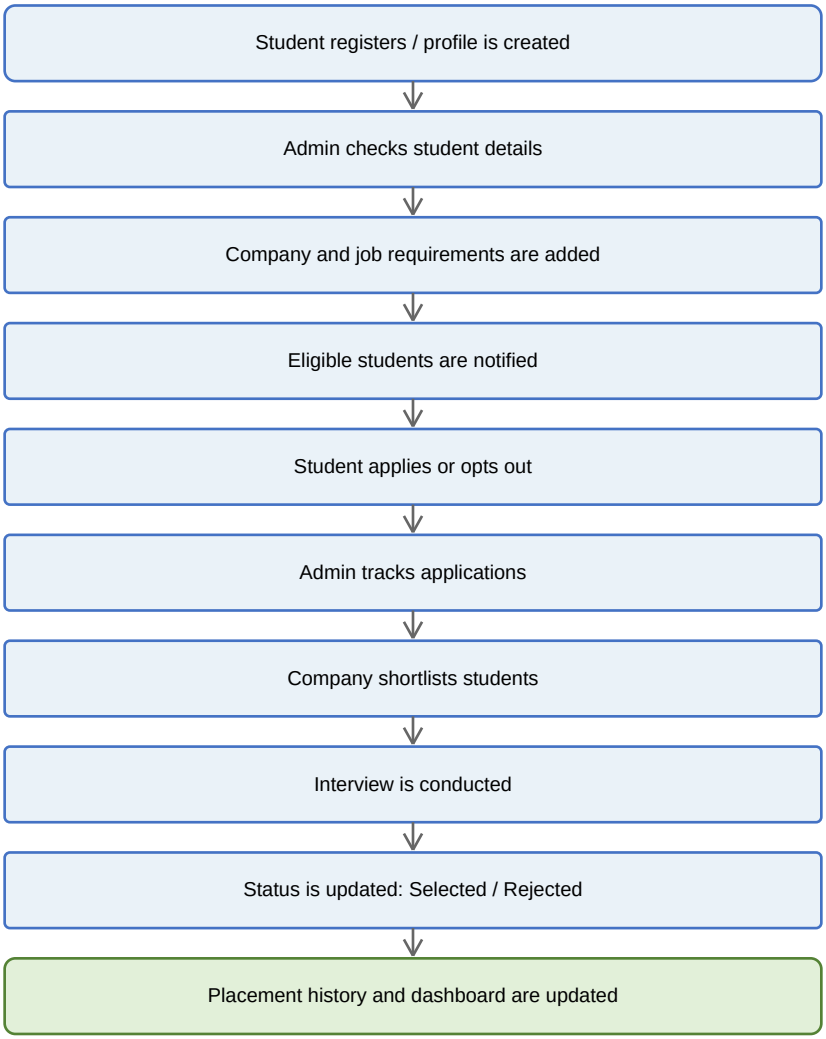
3. Technology Used

I am using **Python** as the main programming language for this project. Python will be used to write the program logic and handle tasks such as student profiles, job applications and status updates.

The final database, web framework and page-design technology will be selected during development. I will add their names after they are finalised.

4. Overall Project Flow

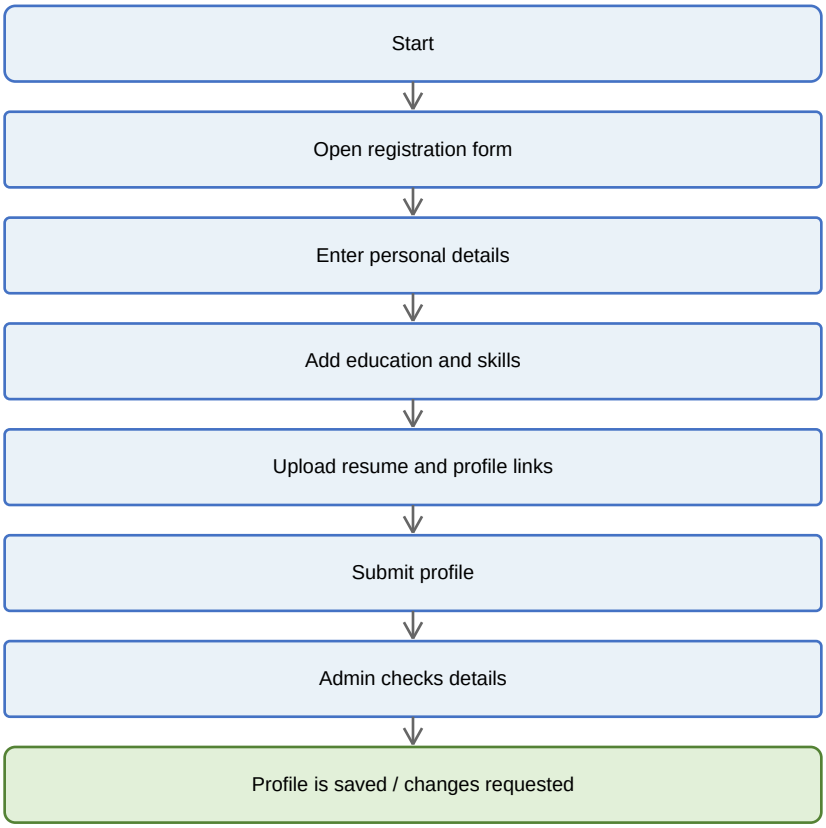
Placement System – Main Flow



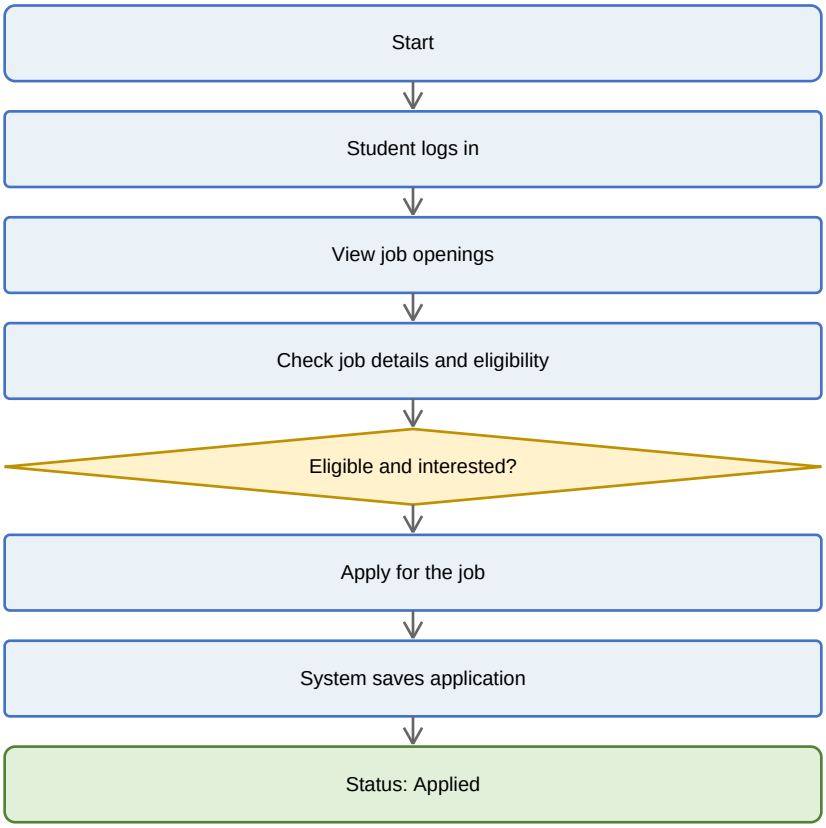
5. Activity Diagrams

Activity diagrams show the steps followed to complete an activity.

5.1 Student Profile Creation

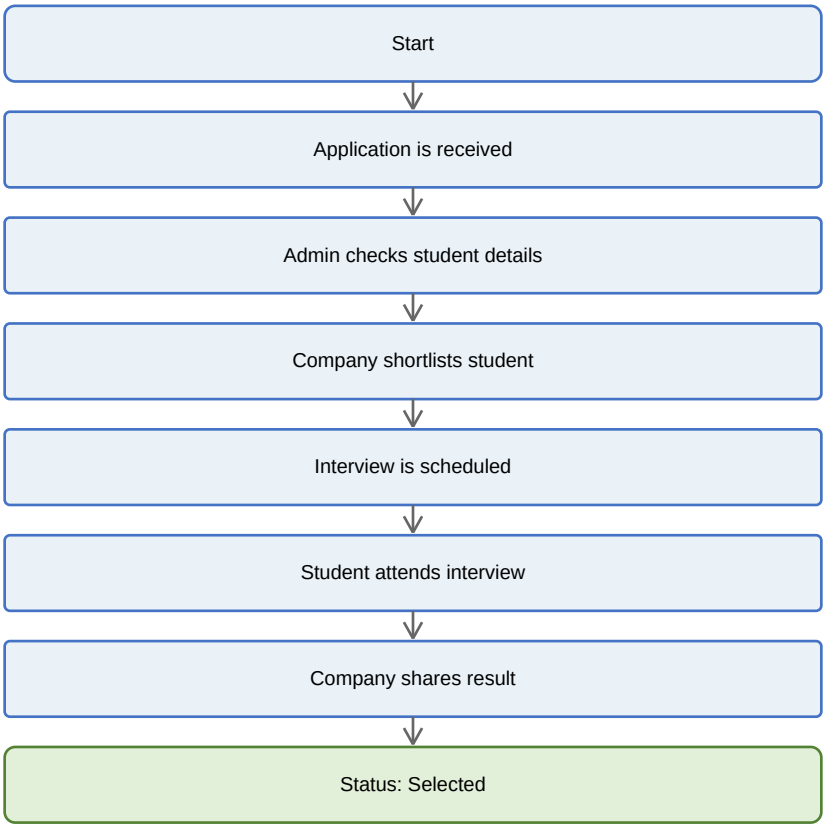


5.2 Student Job Application



5. Activity Diagrams (continued)

5.3 Student Selected Process

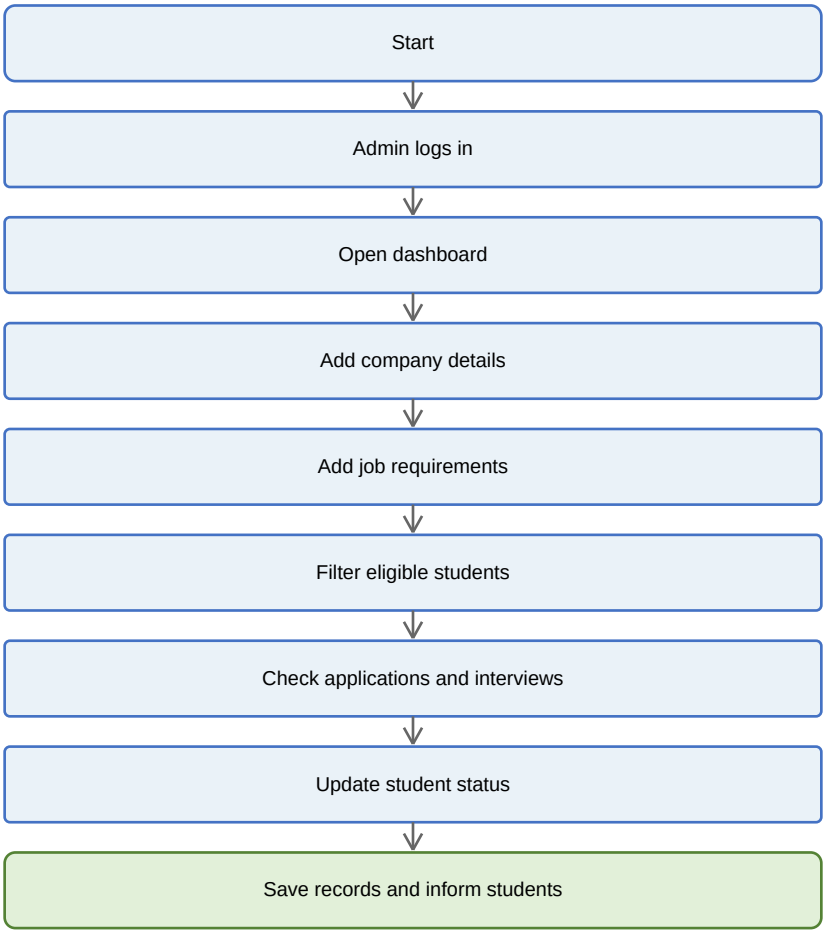


5.4 Student Rejected Process

6. Admin Diagram

This diagram shows the main work done by the placement officer.

Admin Work Flow



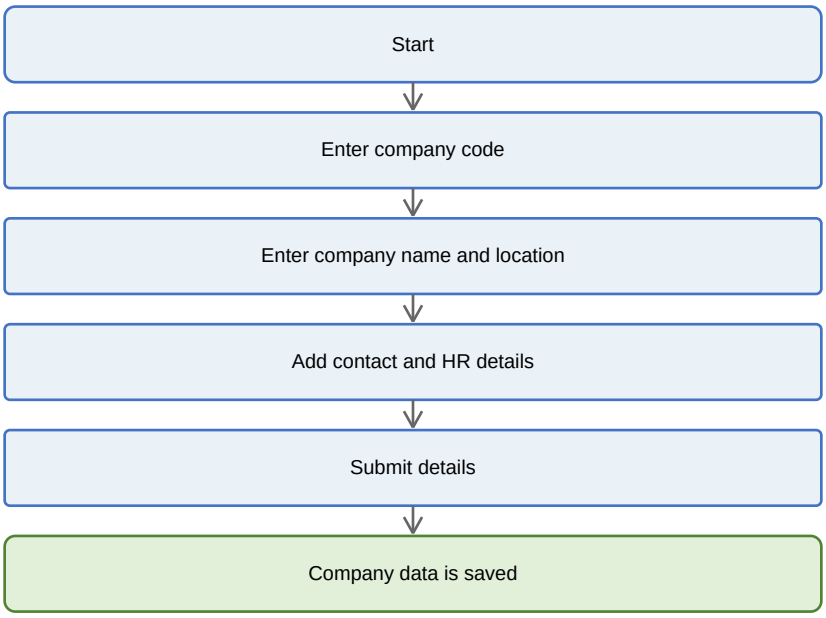
7. Company Data

The placement team stores company details and job requirements in the system.

Company details: Company ID, name, location, domain, head office, phone, branches, email and LinkedIn profile.

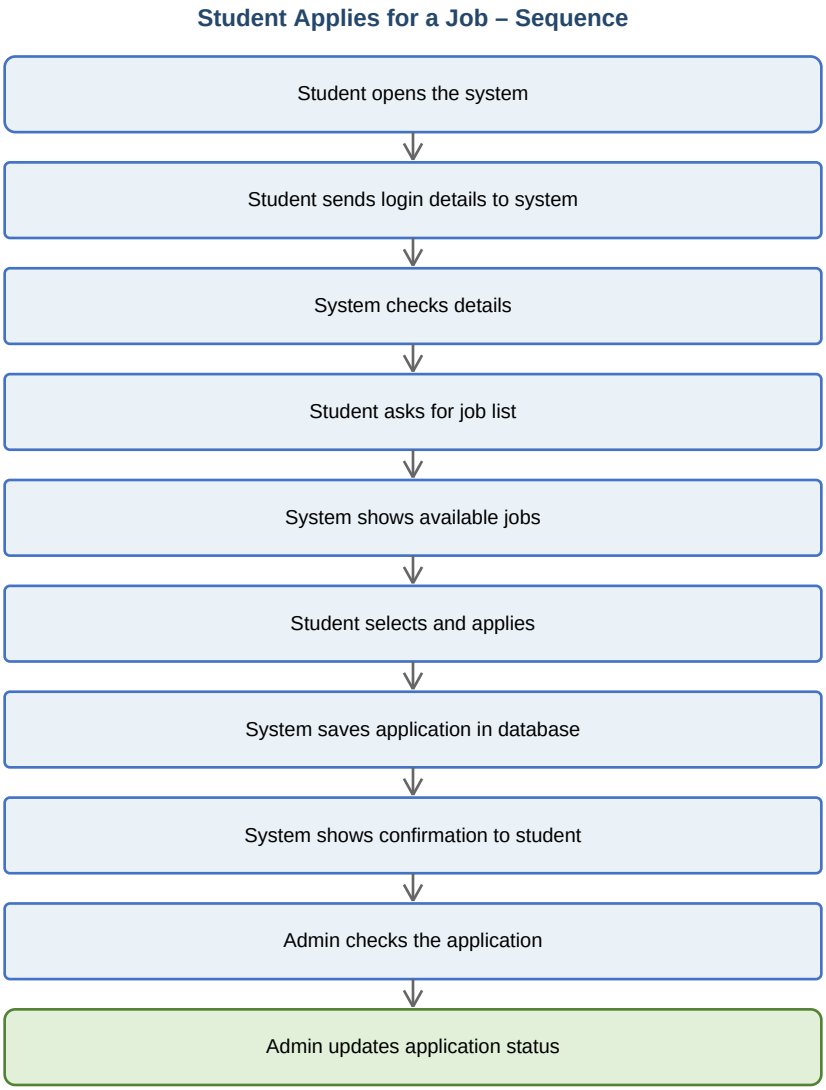
Job details: Company name, position, domain, qualification, package, location, contract type, skills and experience.

Company Registration Flow



8. Sequence Diagram

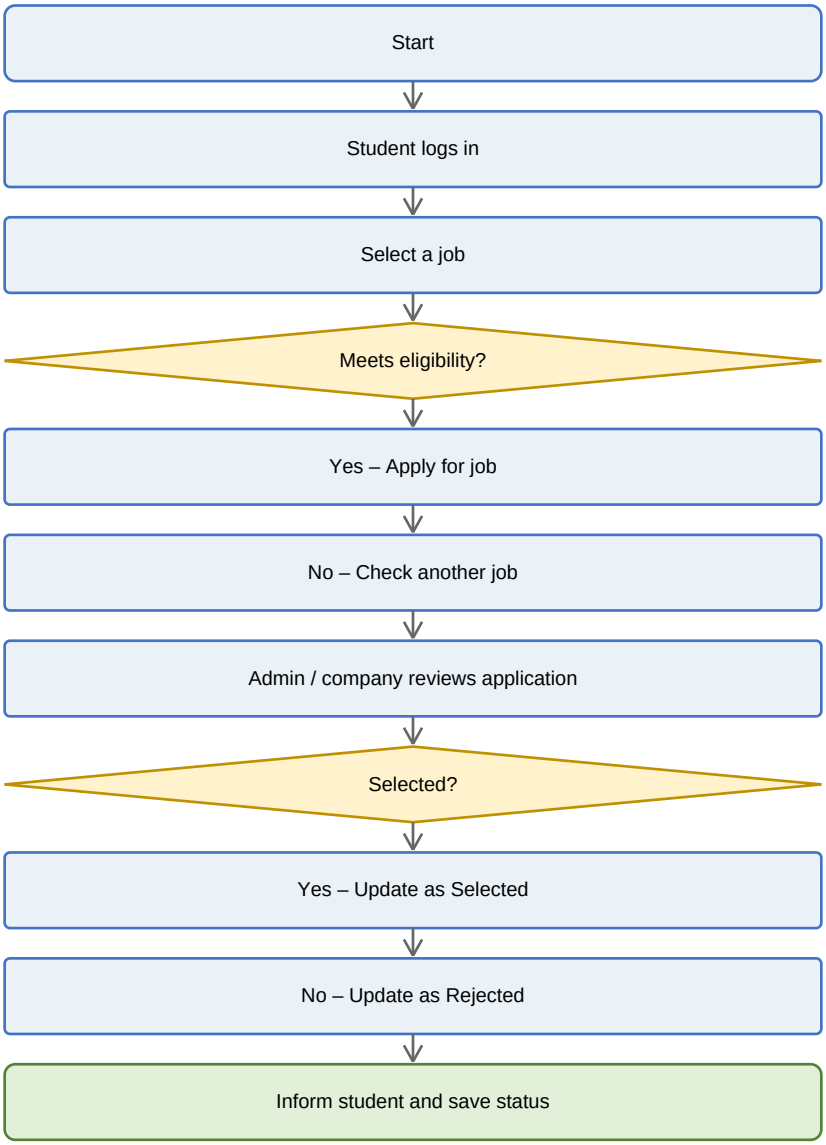
A sequence diagram shows the order in which the student, system, database and admin communicate.



9. Flow Diagram

This diagram shows the decision made during the job application process.

Job Application Flow



10. Use Case Diagram

A use case diagram shows what each user can do in the system. Draw three stick figures (Student, Admin and Company), then connect them to the related ovals.

User	Activities (draw each as an oval)
Student	Register / Login; Manage Profile; Upload Resume; View Jobs; Apply for Job; Opt Out; View Status
Admin / Placement Team	Approve Student; Add Company; Add Job; Filter Students; Track Applications; Update Status; Manage Interviews; View
Company	Maintain Company Details; Add Job Requirements; Set Eligibility; Share Hiring Status

11. Class Diagram

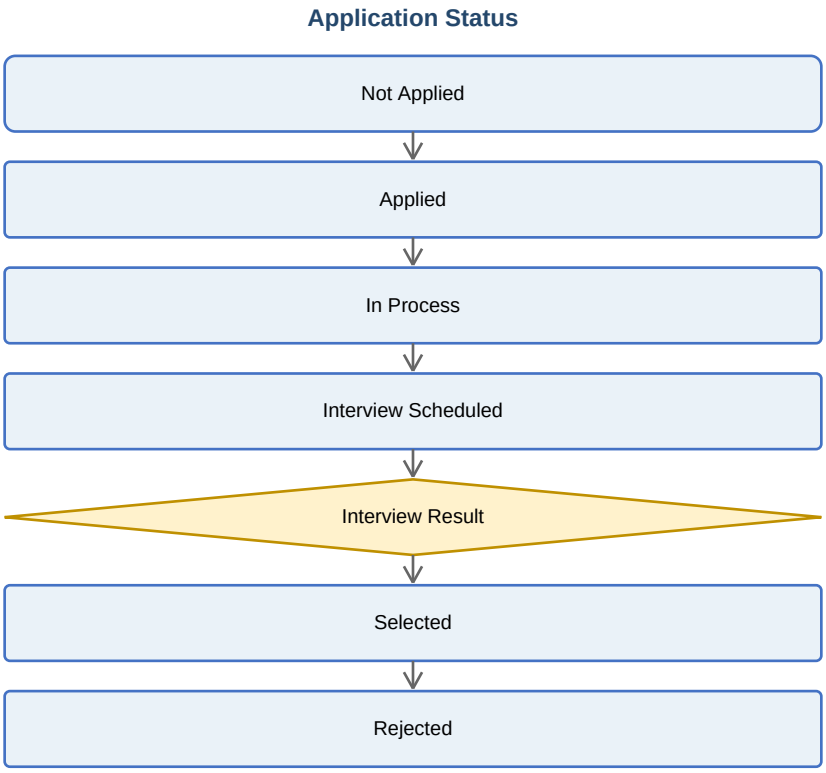
A class diagram shows the main data classes and their details. Draw one box for each class with its attributes.

Class	Attributes
Student	student_id, name, email, phone, address, skills, qualification, resume
Admin	admin_id, name, email, password
Company	company_id, name, location, domain, phone, email, HR contact
Job	job_id, company_id, position, qualification, package, location, skills
Application	application_id, student_id, job_id, applied_date, status
Interview	interview_id, application_id, date, time, location, result

Relationships: One company can post many jobs. One student can apply for many jobs. One job can receive many applications. An application can have interview details.

12. State Diagram

A state diagram shows how the status of one job application changes.



13. Project Development Steps

• Requirement gathering – understand what the users need.

• Functional flow – decide how the system will work.

• Database design – plan how information will be stored.

• UML diagrams – draw diagrams to understand the system.

• Backend logic – write the main functions using Python.

• Frontend flow – plan the screens and forms.

• Admin operations – manage companies, jobs and student status.

• Testing – check that the system works correctly.

14. Conclusion

This project will help the college manage student details, companies, job openings, applications and interviews in one place. It will reduce manual work and make the placement process easier. Python will be used for the main programming logic.

15. Simple Explanation for Viva

What is your project?
My project is Student Placement and Recruitment Management System. It helps students apply for jobs and helps the placement team manage companies and student selection.

What is the scope?
Students can create profiles, upload resumes, view jobs and check their status. Admin can add companies and jobs, filter students and manage interviews.

Which technology are you using?
I am using Python as the main programming language.

Why is this project useful?
It saves time, reduces manual work and keeps placement information in one place.

Which diagrams have you prepared?
Project flow, activity, admin, company registration, sequence, flow, use case, class and state diagrams.

Before submitting: Add your name and class if required by your teacher. Confirm whether diagrams should be hand-drawn or computer-made. The diagrams in this PDF are simple draft diagrams; update them if your teacher asks for a different format.
